Some Problems of Work Conditions in the Industrial Enterprises of the People's Republic of Serbia during the period 1956-1957. (Neka pitanja uslova rada u industrijskim preduzećima u NR Srbiji, period 1956-1957 g.)

PERIODICAL:

ABSTRACT:

The author deals with working conditions directly affecting the health of workers and the productivity of plants. Work premises in Serbia, while in most cases adequate regarding the available floor space per person, are much overcrowded with machines, equipment, semi-finished and finished products and present a serious impediment to a smooth production. The best example for this is the Fabrika obuće (Footwear Plant) "Proleter" in Beograd which is equipped with modern machinery but

public of Serbia during the period 1956-1957.

premises are overcrowded and the conditions un-
hygienic especially in upper stories where the tempera-
ture rises to 36° C during summer months. Some plants
have already introduced partial air-conditioning and
ventilation equipment, i.e. the weaving mill of the
tekstilna industrija (Textile Industry) "Beograd",
Fabrika vunenih tkanina (Woolen Fabrics Plant) "Okto-
barska sloboda" in Beograd, Plants "Ratko Pavlović" in
Niš, "Sutjeska" in Zemun and Tekstilna industrija (Tex-
tile Industry) in Leskovac. The following plants, i.e.
Fabrika kablova (Cable Plant) in Sevojno, Beogradski
graficki zavod (Graphic Institute of Beograd) and the
Zavod za izradu novčanica (Institute for Production of
Bank Notes) in Topčider have satisfactory microclimatic
installations, while the fabrika (Plant) "Viskoza" in

YUG/1-59-3-49/57

Some Problems of Work Conditions in the Industrial Enterprises of the People's Republic of Serbia during the period 1956-1957

Loznica has air-conditioning installations. A great number of plants still depend for air-conditioning on ventilation by draughts through windows and doors, even during winter months. Some of these plants are the two fabrike kemiske industrije (Chemical Industry Plants) "Zorka" in Šabac and Subotica, Fabrika (Plant) "14 Oktobar" in Kruševac, "Magnohrom" in Kraljevo and "Ivo Lola Ribar" in Železnik. Poisonous gases, steam, and decomposition of organic materials also affect health and production. Much has been done in Yugoslav plants to protect the workers but much still remains to be done in this field. The use of protective clothing and equipment, i.e. glasses, gloves, etc, have not become widespread, mainly because workers refuse to wear such equipment. The biggest danger in this

cosis, To prevent this disease special respirators should be worn by the workers, but they are not manufactured in Yugoslavia. Rubber gloves and boots are also not provided in adequate quantities, and the question of protection against poisonous liquids has not yet been solved since no adequate protection exists. The author emphasizes that great efforts are being made to purchase sufficient and adequate personal protective clothing and equipment. Sanitary arrangements in the Serbian plants leave much to be desired; drinking water is practically unavailable except in Beograd and some larger cities, the number of showers inadequate or not fully utilized by the workers, dining halls rare and sanitary arrangements for women workers inadequate in most places. In the opinion of the author health stations in every plant employing over 500 workers,

"Minimum Health Protection for School Children and Adolescents"
Belgrade, Narodno zdravlje, Vol 22, No 2, 1966, pp 45-48

Abstract: The authors discuss the following ways in which health protection for school children can be achieved: 1. Prevention of diseases for which immunobiological medicines exist; 2. Early discovery and diagnosis of diseases and their treatment; 3. Providing space, personnel and equipment for health institutions protecting children from 7 to 18 years of age; 4. Controlling and providing nutrition for children in school and at home; 5. The social-medical regulation of the environment in which children live, work, and go to school. No references.

Vučković, Vladeta. Une extension de la condition de convergence dans les théorèmes de nature tiberienne. Srpska Akad. Nauka. Zbornik Radova 35 (1953) no. 3, 75-84 (1953). (Serbo-Croatian. French summary)

1/2

Let $\alpha(x)$ be nondecreasing and continuous on the right on $(0, \infty)$, with $\alpha(\infty) = \infty$. Then $\int_0^x f(t) d\alpha(t) = o(1)$ as $x \rightarrow \infty$ implies $f(x) = o(1)$ as $x \rightarrow \infty$ if an appropriate Tiberian condition is satisfied. With a suitable $X \sim \bar{X}$ the Schur's condition is

$$\liminf_{x \rightarrow \infty} \sup_{0 < t \leq x} \frac{f(t)}{f(x)} \geq 0 \quad (1)$$

while Karamata has considered the two generalizations (with appropriate functions ρ, Φ)

$$\liminf_{x \rightarrow \infty} \sup_{0 < t \leq x} \frac{\rho(x) f(t)}{\rho(x) f(x)} \geq 0 \quad (2)$$

$$\liminf_{x \rightarrow \infty} \min_{0 < t \leq x} \frac{\Phi(f(t))}{\Phi(f(x))} \geq 0 \quad (3)$$

The author establishes the following Tauberian condition which generalizes both of Karamata's

$$\liminf_{x \rightarrow \infty} \min_{0 < t \leq x} \frac{\rho(x) \Phi(f(t))}{\rho(x) \Phi(f(x))} \geq 0 \quad (4)$$

OVER

W. S. T. Jackson

Here $\phi(x)$ is the left-continuous inverse of $\alpha(x)$ and $X = \phi(\alpha(x))$. $\phi(x)$ is continuous and strictly increasing; $\phi(x) \approx \alpha(x)$ uniformly for $x \in X$ and

$$\limsup_{\epsilon \rightarrow 0} \max_{\alpha(x) \leq \alpha(x) + \epsilon} |\phi(x) - \alpha(x)| = o(1), \quad \epsilon \rightarrow 0$$

Special cases include the following: (1) If $F(x) \rightarrow A$ and $\phi(F(x)) \rightarrow 4[F(x)]F'(x) \rightarrow 0$ then $F'(x) \rightarrow 0$ (2) If $\sum f_n$ converges and

$$|f_n|^{p(n)} \rightarrow 0, \quad n \rightarrow \infty, \quad \text{then } n(f_n) \rightarrow 0 \text{ if } n \rightarrow \infty \text{ and } n \rightarrow \infty$$

then $n(f_n) \rightarrow 0$

"Some t ecreens relating to the Stiletjes transformation. p. 63, (PUBLICATIONS, Vol. 6, 1954, Beograd, Yugoslavia)

SO: Monthly List of East European Accessions, (LAL), LC, Vol. 4, No. 4, Apr 1955, Uncl.

Vucković, Vladeta. Die Stieltjes-Transformation die mit der Geschwindigkeit der Exponentialfunktion unendlich klein wird. Srpska Akad. Nauka Zbornik Radova 35 Mat. Inst. 3, 253-288 (1953). (Serbo-Croatian. German summary.)

Let $A(u)$ be of bounded variation on every finite interval, with $A(0) = 0$. let

$$S(x) = \int_0^\infty (u+x)^{-\alpha} dA(u), \quad L(s) = \int_0^\infty e^{-su} dA(u).$$

The following are the principal theorems. If

(1) $S(x) = O(\exp(-x^\alpha))$, $x \rightarrow \infty$, $0 < \alpha \leq \frac{1}{2}$,

then

$$L(s) = \int_0^\infty e^{-su} A(u)^{\gamma} du, \quad \gamma > -1$$

is regular at $s=0$. If (1) holds and with $\beta > -\alpha$, we have

(2) $u^\beta [A(v) - A(u)] > -m$ for $u \leq v \leq u + u^{1-\alpha}$, then (3)

$A(u) = O(u^{-\alpha})$, $u \rightarrow \infty$. If $L(s) = O(\exp(-s^{-\alpha}))$, $s \rightarrow 0^+$,

$0 < \alpha \leq \frac{1}{2}$, and if (2) holds, then (3) holds. If (1) holds with

$\alpha > \frac{1}{2}$, then $A(u) = 0$. The author gives a historical survey of (over)

TITLE: Roasting with evaporation of the concentrate of
antimony sulfide from the Lojana (Macedonia) Jrc

PERIODICAL: Tehnika, no. 7, 1962, 1299-1302

TEXT: The aim of this work was to establish the effect of the temperature and duration of roasting on the rate of formation and evaporation of Sb_2O_3 , and to evaluate the behavior of nickel in this process. Antimony concentrate (52.62% Sb) mixed with ca. 60% by weight of coke (to prevent sintering and to promote the formation of Sb_2O_3 from Sb_2O_4 and its evaporation) was heated in a laboratory rotary tubular furnace to 850-1050°C. The maximum amounts of evaporated Sb (95.68 and 95.36% of the total Sb) were observed at 950 and 980°C, respectively, the process lasting 6 hours. A shorter treatment (2 hours) sufficed at 1050°C when the proportion of evaporated Sb was 93.57%, but this was associated with a noticeable sintering

Card 1/2

Roasting with evaporation ...

Y/001/62/000/007/001/001

of the material. The highest yield of evaporated Sb was obtained when the concentrate with coke was first roasted for 6 hours at 850°C, and then for 2 hours at 1020-1100°C; the yield of evaporated Sb was then 97.76% of total Sb. The evaporated Sb_2O_3 contained certain amounts of As (up to 7%), and S (ca. 0.5% at higher temperatures). Any nickel present in the concentrate remains in the roasted residue, the Ni content being 0.6-1.0%. The product obtained by roasting with evaporation is an Sb concentrate (64-74%) in which Sb is mainly in the form of Sb_2O_3 ; 93% of the concentrate is below 325 mesh. There are 1 figure and 3 tables. ✓

ABSTRACT	: Germanium has been extracted from copper concentrates containing 0.01% Ge or from flue dust from copper-smelting furnaces containing 0.087% Ge by melting down copper buttons and by volatilizing the sulfides. The high S content made it impossible to obtain satisfactory enrichment of the buttons in germanium. Volatilization of the sulfides at 1,000° in a stream of H ₂ from copper concentrates permitted the achievement of a twenty-fold enrichment of the germanium. Under

AUTHORS: Gurin, A. I., Yudina, I. V.

TITLE: Vertical motion of a rocket in a non-uniform gravity field with allowance for medium resistance

PERIODICAL: Referativnyy zhurnal, Astronomiya i Geodeziya, no. 7, 1962, 98, abstract 7A744 ("Uch. zap. Mosk. gor. ped. in-ta im. V. P. Potemkina", 1960, v. 86, 77 - 107)

TEXT: The authors derive a differential equation for the motion of the rocket mass center in a non-uniform gravity field with allowance for medium resistance during the vertical translational rocket motion, assuming the movements of gas particles in the rocket to be steady. They determine the law of rocket velocity variation for various sections of the rectilinear trajectory of the mass center, coinciding with the Earth radius direction. The trajectory mentioned is divided into 3 sections: The 40 - 50 km section where air medium resistance can not be neglected, a section where gravity field can not be neglected, and at last an ideal section of the trajectory without gravity and medium resistance. There are 5 references.

TITLE: Study of the processes of magnetic reversal in uniaxial ferromagnetic films by means of the two-dimensional Hall effect 2

SOURCE: Fizika metallov i metallovedeniye, v. 21, no. 6, 1966, 824-827

TOPIC TAGS: Hall effect, magnetization, permalloy, ferromagnetic film

ABSTRACT: After showing that the two-dimensional Hall effect can be used for studying magnetic reversal processes in ferromagnetic films, the authors propose a method for plotting the hysteresis loops of the two-dimensional Hall effect for various directions of the field causing magnetic reversal. The method is based on the model of homogeneous rotation. The theoretical loops are compared with the experimental ones for uniaxial permalloy films. Values of the critical fields are determined from the experimental loops, and curves are plotted for their dependence on the direction of magnetic reversal in the film. The shape of these curves is different for films with different structures of the interdomain walls. Authors thank Prof. R. V. Telesnin for his interest in the work. Cracking of high-boiling fractions from sour crude oils

with silica-alumina catalysts. Y. V. Agilov, V. P. Sakhov, L. I. Ponomarev, and L. N. Golitsyn. *Russ. Chem. Rev.* 1989, 58, 27. In Russian, Engl. translation in (7). The catalytic cracking of full-boiling range crude oils and heavy residue with a silica-alumina catalyst is compared with straight-through coking processes with fluidized coke beds as the heat-transfer medium. Coking at moderate temps produces high yields of heavy distillates, b. above 350° and coke and low yields of low-boiling gasoline fractions. Use of high temps gives high gas yields and a high concn. of aromatic hydrocarbons in the middle fractions which cause difficulties in utilization and further processing. High recycle rates are necessary which lower the capacity of coking plants. David

TITLE: Use of the planar Hall effect for the study of the rotational hysteresis in ferromagnetic films

SOURCE: ^{2/} AN SSSR. Doklady, v. 167, no. 2, 1966, 326-329

TOPIC TAGS: Hall effect, magnetic hysteresis, magnetic thin film, permalloy, magnetic domain structure, magnetic anisotropy

ABSTRACT: The rotational hysteresis was measured in single-domain films grown by a method described by the author earlier (DAN 160, 77, 1965 and elsewhere). The method of measuring the potential difference was also described in these papers. The external applied field in the plane of the film was 200 Oe. The rotation of the field in the plane of the film was by rotating the film holder itself, the angle of which could be determined accurate to one-half degree. The

ACC NR: AP6010426

current was maintained constant during the plotting of the angular dependence of the Hall emf. The film was permalloy (78% Ni, 22% Fe) and its thickness was 900 Å. No hysteresis was noticed at 1 Oe and 60 Oe, but a noticeable hysteresis was observed at 3 Oe, which was still seen at 5 Oe but to a smaller degree. A ratio of the hysteresis loss to the Hall emf plotted against the ratio of the field to the coercive force showed noticeable deviation from theory with increasing film thickness, owing to the presence of domain structure and dispersion of the anisotropy. The results are interpreted from the point of view of the theory of hysteresis of jets, developed by E. Feldtketter (Zs. angew. Phys. v. 17, 121, 1964) and H. Hoffman (Phys. Stat. Solid. v. 7, 81, 1964). The author thanks Ye. F. Kuritsyna for valuable hints. This report was presented by Academician G. V. Kurdyumov 29 June 1965. Orig. art. has: 3 figures and 8 formulas.
